

Indian Semiconductor Startup Landscape 2026

Written from the earliest stage of the market - what we hear from founders, institutions, policy makers and operators across India, rather than what the data alone would show.

ABOUT SPECIALE INVEST

At Speciale Invest, co-founded by Vishesh Rajaram and Arjun Rao in 2018, we are not just investors but partners in the truest sense, deeply invested in the long-term success of deep tech startups in India. Our focus spans six thematic areas:

The Sovereign Stack

Beyond The Planet

Clean Energy & Sustainability

Advanced Manufacturing

Redesigning Life

Cognitive Code

We specialize in pre-seed to Series B stage investments. We understand deep tech startups' unique challenges, especially when pricing the early technology risk. Our team collaborates with founders to navigate these waters, leveraging our deep industry and technical expertise. Beyond capital, we provide a robust support network that includes:

→ **Strategic Guidance for Future Funding:**

We assist our startups in future rounds of fundraising, ensuring sufficient runway for their milestones.

→ **Unparalleled Access to Industry Networks:**

Our founders gain access to any boardroom in India thanks to our extensive network in industry.

→ **Acquisition of First Customers:**

We play a crucial role in helping startups acquire their first customers, setting the stage for growth.

→ **Recruitment Support:**

We recognize the importance of building a strong team and offer hands-on support in hiring top talent.

→ **Operational and Strategic Support:**

From navigating regulatory landscapes to refining business models, we provide the operational and strategic expertise necessary to scale efficiently.

We're committed to building a future by supporting extraordinary founders in their mission to tackle some of the world's most pressing challenges through deep tech solutions.

ABOUT STARTUP POLICY FORUM (SPF)

Startup Policy Forum (SPF) is an independent, not-for-profit industry alliance representing over 75 of India's leading new-age technology companies, with a combined valuation exceeding USD 100 billion. SPF brings together founders from across fintech, consumer technology, deep tech, healthtech, mobility and other sectors, with members including Zerodha, Razorpay, Pine Labs, Groww, OYO, CRED, Meesho, InVideo, Digantara, ixigo, Curefoods and CARS24.

Founded to bridge the gap between startups, policymakers, and global ecosystems, SPF operates across four core pillars: policy advocacy, global visibility, community building, and thought leadership. Our work includes high-level roundtables with senior policymakers and ministerial engagements with leaders such as Minister Piyush Goyal, SEBI Chairperson Tuhin Kanta Pandey, and Minister Jyotiraditya Scindia, alongside curated international programmes such as Startup Safari: US Edition, featuring engagements at NASDAQ, the United Nations, NVIDIA, OpenAI, and with leading global investors. Through these efforts, SPF provides a robust platform for dialogue, collaboration, and action, ensuring that innovation and regulation evolve together.

In a short span, SPF has established itself as a trusted and influential voice for India's new-age economy. We have partnerships with government institutions such as DPIIT (Ministry of Commerce & Industry), MeitY Startup Hub, and IIT Madras, as well as global organisations including the US-India Strategic Partnership Forum, US-India Business Council, and Meridian International Center, reinforcing SPF's credibility both in India and globally.

ABOUT THE REPORT

India's semiconductor sector is moving from four decades of design services into its first real wave of product companies. Only in the last five years has the combination of policy, capital and domestic demand made it possible to build product companies here rather than service businesses for someone else.

This report is our reading of that change. It draws on the founders we meet, the institutions we work alongside, and the conversations we have with policy makers, incubators, accelerators and the global semiconductor centres based in India.

We look at where companies are being formed and funded, which markets they sell into, who is founding them, how incubators and corporate investors are supporting them, and how the first exits are taking shape. We also examine what the India Semiconductor Mission has set in motion, and what its second phase changes for early-stage companies.

This is not a primer on semiconductors, and it is not a complete market map. It is a view from the earliest stage of the market – what we see in our deal flow, what we believe follows from it, and what we will be watching between 2026 and 2030.

The report borrows findings from the presentations made by the authors from Speciale Invest along with [Vishal Katariya](#) at [Ankur Capital](#) at the 2nd and 3rd Annual SemiX Summits in 2024 and 2025 hosted by SemiX at IIT Bombay.

If you are building in this space, or investing alongside it, we would like to hear from you.

EXECUTIVE SUMMARY

India has designed chips for four decades. Only in the last five years has the combination of policy, capital and domestic demand made it possible to build product companies here rather than service businesses for someone else. This report is our reading of that shift, written from the earliest stage of the market.

Government support for design startups is helping them raise institutional capital. Private money has followed – cheque sizes are rising, Indian funds are making repeat bets across the stack, and global corporates are moving from captive R&D headcount to equity in Indian startups.

The founder base has matured in parallel. Professors are commercialising deep IP out of IISc and the IITs, senior operators are leaving global captives to build, and the first exits are producing second-time founders. Product focus has widened from digital and edge SoCs into photonics, power, fab tooling and AI-led design software – and Indian OEMs are now designing this silicon into shipping products.

The parts of the stack India has yet to build are, to us, where the next decade of company formation sits. Equipment and materials, design IP and EDA, analog and RF depth – each is an open category with domestic demand already waiting for it. ISM 2.0 widens the aperture further, and the execution phase now under way is what makes these companies backable.

Indian Semiconductor Ecosystem – Over The Years

For four decades India supplied design talent to other countries' chips. Only in the last four years has the domestic capital stack been deep enough to retain it.

Semiconductors in India: 40 years of chip design talent now has the capital and policy to build

DESIGN TALENT WAS NEVER THE GAP. WHAT CHANGED

→ Goals	→ Capital	→ Policy
India's engineers moved from executing design blocks for MNC captives to owning full products and IP at Indian startups.	Public and private capital is now flowing into product-first semiconductor startups.	ISM, PLI and supply-chain diversification arrived together after 2021, giving continuity earlier schemes lacked.

Each wave is harder than the last: from digital edge SoCs to photonics, power and infrastructure silicon

	2021	2022	2023	2024	2025	H1 2026
Wave 1 • Digital, RF & edge	DLI launuced Dec 2021					
Edge AI and non-AI SoCs		Mindgrove, Netrasemi, Big Endian, SenseSemi				
RF and communication		Silizium Circuits, Fermionic				
RISC-V processors		Mindgrove, InCore				
Wave 2 • Physics-heavy						
Photonics		Lightspeed Photonics (2020), Aortic Labs, AmPICQ				
Power and compound semiconductors			Agnit, C2i, Matterwave			
Wave 3 • Infrastructure & AI						
Fab tooling and metrology					Makr Microsystems, Nanomatter	
AI data centre silicon					Agrani, Turiyam AI	
Agentic AI workflows for semiconductors					Maieutic, Archgen, Relsym	
Analog AI inference					OptoML, Numelo, AmmSemi	

Bars mark when each category first appeared in our deal flow; company names are illustrative, not exhaustive.

DLI launched December 2021; 2026 shown through H1 (June 2026)

DLI support has boosted technology development

Design Linked Initiative (DLI) scheme launched in late 2021 under the Indian Semiconductor Mission.

Support domestic chip design firms, MSMEs and startups by reducing the upfront cost-barriers (EDA tools, prototyping) and giving incentives for design, validation and deployment of chips/SoCs or IP.

24

chip-design projects funded by DLI

72

startups / companies given access to industry-grade EDA tools

~\$90M

Approx. project outlay approved under DLI (including cost of EDA tools) for sanctioned projects

DLI Beneficiaries

Government design support is now unlocking private capital for Indian silicon

14 of 24

DLI-supported startups have gone on to raise institutional venture capital since the programme launched

Second rounds are arriving quickly and at a marked step-up, which suggests the milestones the scheme funds are the same ones private investors underwrite.

\$100.8M

raised in total by those companies across their first and second rounds

Capital is concentrating. C2i Semiconductors, NetraSemi, Morphing Machines and Mindgrove account for roughly 56% of the total private fundraise.

6

have already closed a follow-on round, together worth \$53.6M

The pattern gives a usable filter at pre-seed: a DLI award plus a working design partner is a strong leading indicator of the next institutional round.

Growing Private Investment Base And Support Ecosystem

Capital and institutional support are deepening together. Specialist funds, corporate investors and government schemes now sit alongside a widening network of incubators, accelerators and shared design infrastructure

Semiconductor Startup Funding in India (2022-H1 2026)

- ~\$206M across 51 rounds since 2022
- Capital is concentrating into fewer, larger bets – signs of a maturing market
- Average cheque size tripled in two years – \$3.0M in 2024 to \$8.8M in H1 2026
- H1 2026 is already 81% of full-year 2025

Source: Tracxn

Funding information includes design, product, IP and manufacturing tech startups in the Indian semiconductor ecosystem; excludes funding in design services, OSATs and other manufacturing companies

Larger seed rounds raised in 2025 and 2026

Investor appetite is measurably rising with first cheques now landing in the \$4-8M range

Founder pedigree and large end-markets are the common thread – repeat founders and ex-Intel / AMD / Groq operators attacking \$100B+ compute and analog markets

\$7.1M

Seed

Peak XV Partners

Team

Ex-Intel and AMD principal engineers; Vinod Dham (“Father of the Pentium”) as founding advisor

Market

AI datacentre GPUs – \$207B in 2025, projected \$1T+ by 2030

maieutic

\$6M

Seed

Endiya, Exfinity, UTEC (Japan)

Team

Repeat founders – sold Steradian to Renesas (2022); 70+ patents

Market

GenAI copilot for analog IC design

 TURIYAM AI

\$4M

Seed

Ankur Capital, Axilor

Team

Ex-Groq, Lightmatter and AMD; co-founder led India ops at XCOM Labs; 30+ chips shipped

Market

AI inference compute

Findings first presented at the 3rd Annual SemiX Summit at IIT Bombay, September 2025

Startups have raised Series A in less than 18 months from seed

Multiple startups went from Seed to Series A in 7-22 months

Strategics such as Zoho, TDK Ventures now anchor funding rounds

These seven rounds total \$73.7M – roughly a third of all Indian semiconductor startup funding since 2022

\$12M

Edge-AI SoCs for IoT and video
Zoho, Unicorn India Ventures

\$8M

RISC-V microcontroller SoCs
Rocketship VC, Mela Ventures

\$8M

Reconfigurable processors
IAN Alpha Fund, Speciale Invest

\$16.7M

Power chips for AI datacentres
Peak XV, Yali, TDK Ventures

\$6M

Secure AI-vision SoCs
IAN Alpha Fund, Vertex Ventures

\$13M

AI-native SoCs for the edge
Ideaspring, Singularity AMC, Avatar Growth

\$10M

Analog signal-chain ICs
Unicorn India Ventures, Roots Ventures

Findings first presented at the 3rd Annual SemiX Summit at IIT Bombay, September 2025

Indian VC funds are investing in multiple semiconductor startups from their funds

Investor	Startups invested in			
 SPECIALE INVEST	 MINDGROVE	 MORPHING MACHINES		
 peak xv PARTNERS	 MINDGROVE	 C2i	 IncCore	 agrani
 Endiya	 STERADIANSEMI	 maieutic		
 Unicorn INDIA VENTURES	 NETRASEMI Powering Intelligent Edge	 Vervesemi		

Multiple VC funds in India have taken 2 or more bets in semiconductors – indicating growing investor confidence in the sector despite its nascency

- Repeat bets signal conviction in the thesis, not opportunistic one-off allocations
- Funds are backing across the technology stack - from MCUs to inference chips to power semiconductors – and not a single niche
- In-house semicon expertise is building up in VC funds, shortening diligence cycles for new deals

Global corporate VCs are shifting from captive R&D in India to equity in Indian startups

→ Two decades of captive presence

Global majors have run design centres in India since the early 2000s; the shift now is from R&D headcount to equity positions.

→ Strategic capital carries more than money

Fab access, tool credits, reference customers and design-partner status are often worth more to a seed-stage team than the cheque.

→ Entry is a technical validation signal

A corporate investor has benchmarked the team against its own global engineering standards before investing.

Invested in Indian semiconductor companies

Invested in C2i Semiconductors, 2026

Joined the India Deep Tech Investment Alliance; \$850M+ committed with six Indian VC firms

Strategic acquirers active in India

Acquired Steradian Semiconductors, 2022

Active mandate

Incubators give startups access to fabs, tools and mentors without the upfront capital cost

Shared cleanrooms and EDA tools

Faculty and industry mentoring

Grants, space and first customers

INCeNSE
IISC Bengaluru

Cleanrooms, nanofab and characterisation access,
IP guidance, mentoring

SFAL
Bengaluru

EDA tools, design IP libraries, tape-out and prototyping support

SemiX
IIT Bombay

Campus fabrication and test facilities, design tools, faculty mentoring

IITM Pravartak
Chennai

Grant funding, lab and incubation space, route to market

Non-exhaustive; several state-backed and private programmes operate alongside these.

Findings first presented at the 2nd Annual SemiX Summit at IIT Bombay, November 2024

Founder Personas Observed

The founders building semiconductor companies in India fall into a few recognizable profiles, each with distinct strengths, and support needs

Academic deep-IP chip efforts are being commercialized

→ Professors are becoming founders

Researchers with a decade or more in one technology stack are commercialising it, usually pairing with a business co-founder to take it from lab to customer.

→ Two programmes show the pattern

IIT Madras' Shakti RISC-V programme spun out Mindgrove and InCore and many others; IISc's Gallium Nitride research became AGNIT Semiconductors for RF and power devices.

→ The research base is spread across labs

IISc Bengaluru, IIT Bombay and IIT Madras hold the foundational work in photonics, RF and compound semiconductors, and most deep-IP spin-outs trace back to them.

Non-exhaustive; spin-outs shown are those we have met or tracked over the past 5 years
Findings first presented at the 3rd Annual SemiX Summit at IIT Bombay, September 2025

Industry veterans are founding India’s chip startups

→ **Operators are leaving captives to build**

Senior leaders with long careers inside global semiconductor firms are choosing to found rather than stay.

→ **Academia supplies the rigour**

Academic research partners add depth in physics and process that operators rarely carry alone.

→ **They arrive with the full stack of experience**

Design, product management, supply chain, foundry relationships and enterprise sales – all learned on the job over decades.

A team that pairs academic rigour with industry experience is the most compelling proposition for a pre-seed investor

Company	Founder background
 agrani	Ex-Intel and AMD principal engineers
 TURIYAM AI	Ex-Groq, Lightmatter and AMD; co-founder led India ops at XCOM Labs;
 BigEndian Semiconductors	Ex-Intel, Arm, Broadcom, Cypress etc.,
 MOSart Labs Art of VLSI	Ex-OSRAM
 C2i	Ex-Texas Instruments

Non-exhaustive list
Findings first presented at the 3rd Annual SemiX Summit at IIT Bombay, September 2025

2nd-time entrepreneurs in semiconductors

Raja Manickam

Previous Venture

Exited in 2024

New Venture

Second venture. Raised \$5M funding in 2024

Ashish Lachhwani

Acquired by Renesas in 2022

Second venture. Raised \$6M in seed funding in 2025

Parag Naik

Acquired by Tejas Networks in 2022

Second venture. Founded in 2025

Repeat founders are the clearest signal of a maturing ecosystem

→ Three exits in three years: Tessolve (2024), Steradian to Renesas (2022), Saankhya Labs to Tejas (2022)

→ All three founders re-entered semiconductors rather than leaving the sector

→ Their second ventures have already raised \$11M+ between them

Findings first presented at the 3rd Annual SemiX Summit at IIT Bombay, September 2025

Recent Trends In The India Semiconductor Startup Ecosystem

What has shifted over the past few years across company formation, funding, product focus and the areas where new activity is concentrating

Four demand pools where Indian chip startups are building

Data centers

AI build-out drives demand for accelerators, interconnect and power delivery; startups are building compute, networking and power-efficient silicon.

Cameras and vision

High-volume, price-sensitive imaging across surveillance, industrial and automotive; startups are building Image Signal Processors (ISPs), vision SoCs and edge AI processors.

Automotive

Electrification and local vehicle output create volume under an indigenization mandate; startups are building MCUs, sensing and power devices.

RF and communications

Telecom, satcom and defence demand is policy backed; trusted-source rules favour domestic products

Findings first presented at the 3rd Annual SemiX Summit at IIT Bombay, September 2025

The tooling layer is now being built here too — metrology, lithography, process equipment and low-volume fab

Metrology

Measurement, defect detection
and reliability analytics

Lithography

Patterning and nano-fabrication
tools, the hardest layer to localise

Process equipment

Deposition, etch, clean room solutions, and
materials handling for mature-node lines

Low-volume fab

Small-batch fabrication and
prototyping for startups

→ 2023 and 2024 saw policy and investor
attention concentrate on fabless design
startups

→ 2025 and 2026 have brought a wave of
manufacturing and tooling companies - who
have gone on to raise VC funding

→ Demand is anchored by global fabs, academic
institutions and domestic fabs and OSATs
under construction at Dholera, Sanand and
Jagiroad

Findings first presented at the 3rd Annual SemiX Summit at IIT Bombay, September 2025

2025 & 2026 saw the emergence of agentic chip design and workflow platforms

- Startups are applying AI to shorten design cycles that today run 1-3 years for a complex SoC, automating steps in RTL generation, verification and physical design
- Verification and first-pass silicon success remain the sharpest pain points, and most tools target bug detection, coverage closure and sign-off rather than end-to-end automation
- Several players pair the software with their own IP blocks, chips or design services rather than selling tools alone
- Simulation-led flows and digital twins are gaining traction, though adoption is early and concentrated in verification

The opportunity is software margins on a silicon workflow; the risk is Synopsys and Cadence shipping the same feature inside tools customers already own.

maieutic

incore

MANOVEGA AI

ARCHGEN AI

SEMICON OS

Indian startups are partnering with domestic OEMs to get their silicon into the final products

Mindgrove-designed chips for automotive, consumer and IoT, with Bosch contributing R&D and software.

2024

Nine-member consortium to supply over 500,000 fully indigenous dash and surveillance cameras

2025

Co-developed chips with Tata assembling — boAt shifts from international chipset suppliers to a domestic startup.

2025

India's first 4-channel X-band beamformer IC for phased-array radar, including wafer test, packaging and validation.

2025

Findings first presented at the 3rd Annual SemiX Summit at IIT Bombay, September 2025

Exits: From Design Services To Product Companies

M&A activity is building across the ecosystem. Design-services firms account for the bulk of acquisitions so far, while the first product-company exits point to a maturing market and a pipeline of second-time founders

Exits cluster in design services, while three product exits worth \$138M mark the market maturing

Product company exits

Year	Company	Acquirer	Value (\$M)
2022	Steradian Semi	Renesas Electronics	50
2022	Saankhya Labs	Tejas Networks	58
2024	Azimuth AI	Cyient	30

3
product exits

\$138M
total value

\$46M
average deal

All three went to strategic acquirers buying capability, not headcount – Renesas for mmWave radar, Tejas for satellite and broadcast SoCs, Cyient for design IP.

Small in number, but these are the exits that recycle founders and proceeds back into the ecosystem.

Exit proceeds → repeat conviction

Two exits, two lead investors, one new company — exit proceeds and proven founders are being recycled straight back into Indian semiconductor ecosystem.

Findings first presented at the 3rd Annual SemiX Summit at IIT Bombay, September 2025

India's Edge And Opportunities

Where India's semiconductor advantage is real today, where it is not yet, and what both mean for the companies that can be built over the next decade

India's edge: design depth, subsidized capital and sovereign demand

~20%

of the world's chip design engineers (industry estimates)

\$10B + \$13B

ISM 1.0 + ISM 2.0 outlay committed by the Government of India

~ 1/3

the cost of running an equivalent US or EU design team

Design talent at scale

Roughly a fifth of the world's chip design engineers sit in India, with four decades of depth in digital design and verification built inside global captive centres.

Subsidised capital

ISM 1.0 and 2.0 commits a \$10B + \$13B outlay with fiscal support for startups, fabs, OSAT and compound semis.

DLI covers design infrastructure and tape-out costs for startups.

Sovereign demand

Defence, space, railways, smart meters and telecom offer anchor offtake, de-risking a first product cycle in a way purely commercial markets do not.

Where the next decade of company-building sits

Equipment, materials and gases

An entire supply layer still to be built here. Lithography and deposition tools, ultra-pure chemicals and specialty gases are imported today — a large, policy-backed market for domestic suppliers.

IP and EDA ownership

IP licenses and EDA seats are dollar costs, and RISC-V gives Indian teams a credible route to owning more of the stack themselves.

Analog, RF and process depth

Depth beyond digital is the next frontier. Four decades of design and verification strength is now extending into analog, mixed-signal, RF and fab process engineering.

Growth capital for hardware

Pre-seed and seed are well served, and the growth layer is forming. As product exits scale past the current \$30-60M band, deeper Series A and B capital for silicon follows.

Manufacturing track record

Manufacturing is entering its proving phase. First packaged chips are shipping now, with yield, uptime and customer qualification the milestones to watch.

ISM 2.0 And Future Outlook

The second phase of the mission widens the aperture across fabs, packaging, design and R&D – and reshapes the opportunity set for an early-stage investor

Reading ISM 2.0's objectives as an early-stage investment map

ISM 2.0 objective	Where the early-stage opportunity sits	Founders and markets
Logic, memory and display fabs	Fab-adjacent tooling: metrology, yield analytics, materials handling and facilities engineering	Process and equipment engineers from global fabs; the Dholera, Sanand and Assam build-out
Compound semiconductors	SiC and GaN device, module and power-management startups at mature nodes	Power electronics operators; EV, solar, industrial drives and defence radar
Advanced packaging and OSAT	Heterogeneous integration, substrate and thermal IP, test and packaging design services	Packaging and test veterans from captives; Domestic ATMPs plus global OSAT accounts
Design incentives, now open to larger firms and consortia	Fabless SoCs, RISC-V IP cores, AI-assisted EDA and verification tooling	GCC operators and second-time founders; Sovereign demand and global fabless customers
R&D, academia and talent programmes	Deep-IP spin-outs in MEMS, photonics and sensing; shared-infrastructure plays	Academic teams needing commercial co-founders; Long-cycle strategic buyers
Early-stage investment filters: strong holistic founding teams, IP the company owns, a tape-out inside 18–24 months, an anchor customer before Series A		

DLI 2.0: what changes for an early-stage fund, and why it strengthens 2026–2030

What DLI 2.0 changes	What it opens up for us	2026–2030 outlook
Eligibility widens Large companies join startups and MSMEs, and Indian firms can lead consortia with global partners at 51% domestic ownership.	Our seed rupee goes further Non-dilutive design funding covers tooling and tape-out, so the same cheque buys more months of runway and less dilution.	Deeper follow-on capital Corporate participation helps close the Series A and B gap that has capped Indian silicon company-building.
Focus shifts to deployment The redesign targets the design-to-deployment gap, rewarding products that reach customers rather than tape-outs alone.	Strategics enter early Corporate partners in a consortium become natural follow-on investors, design partners and eventual acquirers.	Faster route to revenue Deployment-linked incentives compress the gap between first silicon and qualified customer revenue.
Support infrastructure continues Shared EDA access and tape-out support remain the backbone, keeping early design spend off the cap table.		More exits, sooner Partners who co-develop tend to acquire; the 2022–24 pattern of strategic exits should broaden and repeat.

The base DLI 1.0 hands over (as of January 2026) – the platform DLI 2.0 scales from		
95 startups on the EDA grid	16 tape-outs completed	6 chips fabricated

What we are watching in 2026–27

Signal	What it would tell us
First India-packaged chips shipping at volume	Indicates whether the Sanand and Assam facilities can sustain yield and customer qualification, converting approvals into an operational supply chain
DLI 2.0 support for startups	Reveals how awards are distributed between startups, incumbents and joint ventures, and the residual scope for first-time founders
Series A and B depth for silicon	Determines whether corporate and crossover capital closes the growth-stage gap, and therefore how far seed positions can be carried
The first \$100M+ product exits	Establishes whether Indian fabless outcomes can support venture-scale returns
Sovereign demand converting to volume orders	Establishes whether defence, automotive, industry procurement progresses from pilot awards to repeat volume contracts, validating the anchor-customer thesis
